## Content

1. Site Survey Summary.....	7
1.1. Wireless network survey information.....	7
1.2. Summary of detected networks.....	8
2. Networks .....	14
3. Access Points .....	15
4. Location Survey: 0 - Main floor .....	19
4.1. Location details .....	19
4.1.1. Survey Route .....	20
4.1.1.1. First scan at main floor.....	22
4.1.1.2. Scan passive + active survey.....	23
4.1.1.3. Scan passive + active survey 2.....	24
4.1.2. "0 - Main floor" Access Point Position .....	25
4.2. Network Survey: AsCancelas.....	27
4.2.1. Network Details.....	27
4.2.1.1. AP-based Information .....	27
4.2.1.2. Channel-based Information .....	28
4.2.1.3. "AsCancelas" Access Point Position .....	30
4.2.2. WiFi Quality.....	32
4.2.2.1. Web Browsing WiFi requirements .....	32
4.2.2.1.1. RSSI Coverage.....	32
4.2.2.1.2. Simultaneous RSSI Coverage.....	33
4.2.2.1.3. Channel Overlap.....	34
4.2.2.1.4. Co-Channel Interference .....	35
4.2.2.1.5. Latency .....	36
4.2.2.1.6. Bandwidth .....	37
4.2.2.1.7. Packet Lost .....	38
4.2.2.1.8. Access Point Roaming .....	39
4.2.2.2. VoIP over WiFi requirements .....	40
4.2.2.2.1. RSSI Coverage.....	40
4.2.2.2.2. Simultaneous RSSI Coverage.....	41

- 4.2.2.2.3. Channel Overlap ..... 42
- 4.2.2.2.4. Co-Channel Interference ..... 43
- 4.2.2.2.5. Latency ..... 44
- 4.2.2.2.6. Bandwidth ..... 45
- 4.2.2.2.7. Packet Lost ..... 46
- 4.2.2.2.8. Access Point Roaming ..... 47
- 4.2.3. Survey ..... 48
  - 4.2.3.1. RSSI Heatmap ..... 48
  - 4.2.3.2. RSSI detailed by AP ..... 49
  - 4.2.3.3. RSSI detailed by Channel ..... 52
  - 4.2.3.4. Number of APs ..... 54
  - 4.2.3.5. AP Coverage ..... 55
  - 4.2.3.6. Channel Coverage ..... 57
  - 4.2.3.7. Channel Overlap ..... 58
  - 4.2.3.8. Detailed Grid ..... 59
  - 4.2.3.9. SNR Heatmap ..... 62
  - 4.2.3.10. Data Rate Heatmap ..... 63
  - 4.2.3.11. Data Rate detailed ..... 65
  - 4.2.3.12. Cell Density Heatmap ..... 68
  - 4.2.3.13. Retries Rate Heatmap ..... 69
  - 4.2.3.14. Bandwidth ..... 70
  - 4.2.3.15. Latency ..... 71
  - 4.2.3.16. Packet Loss ..... 72
  - 4.2.3.17. Roaming ..... 73
- 5. Location Survey: +1 - Stores ..... 75
  - 5.1. Location details ..... 75
    - 5.1.1. Survey Route ..... 76
      - 5.1.1.1. Scan between stores ..... 78
      - 5.1.1.2. Scan passive + active survey ..... 79
    - 5.1.2. "+1 - Stores" Access Point Position ..... 80
  - 5.2. Network Survey: AsCancelas ..... 82

5.2.1. Network Details.....	82
5.2.1.1. AP-based Information .....	82
5.2.1.2. Channel-based Information .....	83
5.2.1.3. "AsCancelas" Access Point Position .....	85
5.2.2. WiFi Quality.....	87
5.2.2.1. Web Browsing WiFi requirements .....	87
5.2.2.1.1. RSSI Coverage.....	87
5.2.2.1.2. Simultaneous RSSI Coverage.....	88
5.2.2.1.3. Channel Overlap.....	89
5.2.2.1.4. Co-Channel Interference .....	90
5.2.2.1.5. Latency .....	91
5.2.2.1.6. Bandwidth .....	92
5.2.2.1.7. Packet Lost .....	93
5.2.2.1.8. Access Point Roaming .....	94
5.2.2.2. VoIP over WiFi requirements .....	95
5.2.2.2.1. RSSI Coverage.....	95
5.2.2.2.2. Simultaneous RSSI Coverage.....	96
5.2.2.2.3. Channel Overlap.....	97
5.2.2.2.4. Co-Channel Interference .....	98
5.2.2.2.5. Latency .....	99
5.2.2.2.6. Bandwidth .....	100
5.2.2.2.7. Packet Lost .....	101
5.2.2.2.8. Access Point Roaming .....	102
5.2.3. Survey.....	103
5.2.3.1. RSSI Heatmap .....	103
5.2.3.2. RSSI detailed by AP.....	104
5.2.3.3. RSSI detailed by Channel.....	107
5.2.3.4. Number of APs .....	109
5.2.3.5. AP Coverage .....	110
5.2.3.6. Channel Coverage .....	112
5.2.3.7. Channel Overlap.....	113

- 5.2.3.8. Detailed Grid ..... 114
- 5.2.3.9. SNR Heatmap ..... 117
- 5.2.3.10. Data Rate Heatmap ..... 118
- 5.2.3.11. Data Rate detailed..... 120
- 5.2.3.12. Cell Density Heatmap ..... 123
- 5.2.3.13. Retries Rate Heatmap ..... 124
- 5.2.3.14. Bandwidth ..... 125
- 5.2.3.15. Latency ..... 126
- 5.2.3.16. Packet Loss ..... 127
- 5.2.3.17. Roaming ..... 128
- 6. Location Survey: +2 - Cinema ..... 130
  - 6.1. Location details ..... 130
    - 6.1.1. Survey Route ..... 131
      - 6.1.1.1. Scan through restaurants ..... 133
      - 6.1.1.2. Scan passive + active survey..... 134
    - 6.1.2. "+2 - Cinema" Access Point Position ..... 135
  - 6.2. Network Survey: AsCancelas ..... 137
    - 6.2.1. Network Details..... 137
      - 6.2.1.1. AP-based Information ..... 137
      - 6.2.1.2. Channel-based Information ..... 138
      - 6.2.1.3. "AsCancelas" Access Point Position ..... 140

6.2.3.13. Retries Rate Heatmap .....	179
6.2.3.14. Bandwidth .....	180
6.2.3.15. Latency .....	181
6.2.3.16. Packet Loss .....	182
6.2.3.17. Roaming .....	183

## 1. SITE SURVEY SUMMARY

### 1.1. WIRELESS NETWORK SURVEY INFORMATION

This section contains general information regarding the wireless environment analysis using Acrylic WiFi Heatmaps.

<b>Project Name</b>	<b>Demo Project 1</b>
<b>Client</b>	<b>As Cancelas</b>
<b>Description</b>	<b>Shopping center site survey</b>
<b>Data</b>	<b>11/06/2015</b>
<b>Selected Locations</b>	<b>3</b>
<b>Selected Scans</b>	<b>7</b>
<b>Selected Stations</b>	<b>29</b>

## 1.2. SUMMARY OF DETECTED NETWORKS

The following table summarizes Networks, MAC addresses and physical APs granting network accesses at different locations:

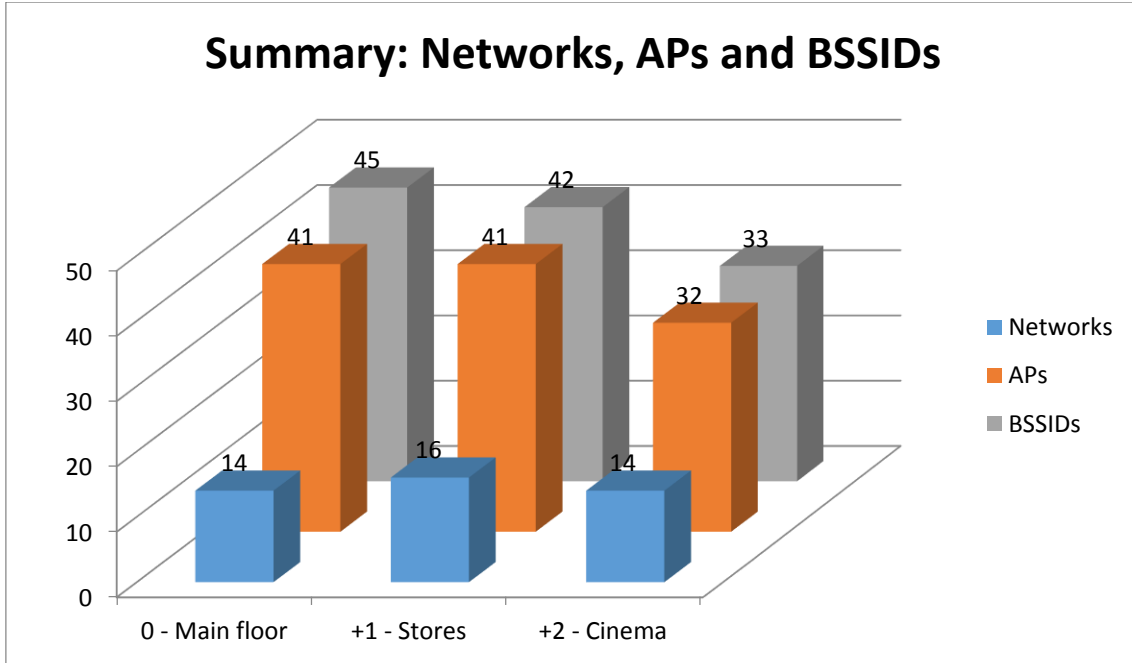

- Location: Physical area where monitoring takes place.
- Networks: Number of Networks detected.
- Access Points (APs): Number of physical access points.
- BSSIDs: Access points (MAC addresses) granting network access.

The number of BSSIDs can exceed the number of physical APs because a single AP can propagate more than one network by using different MAC addresses.

LOCATION	NETWORKS	APs	BSSIDs
<b>0 - Main floor</b>	14	41	45
<b>+1 - Stores</b>	16	41	42
<b>+2 - Cinema</b>	14	32	33
<b>Total</b>	<b>17</b>	<b>45</b>	<b>49</b>

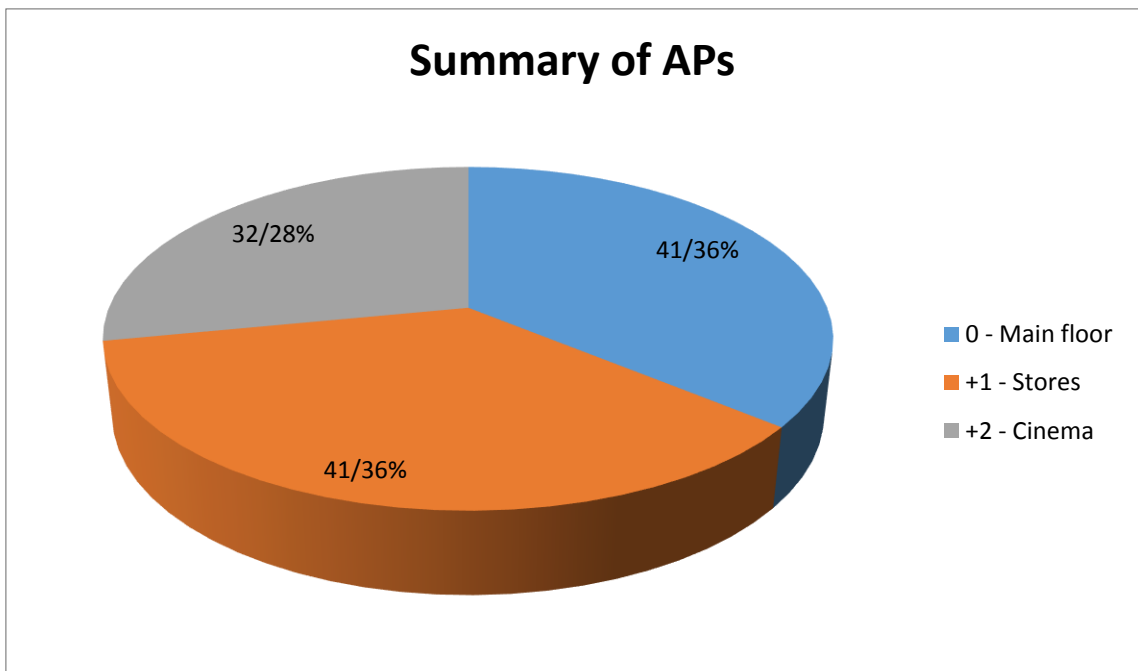

The following graph shows a comparison between the number of networks, physical APs and BSSIDs at each location.

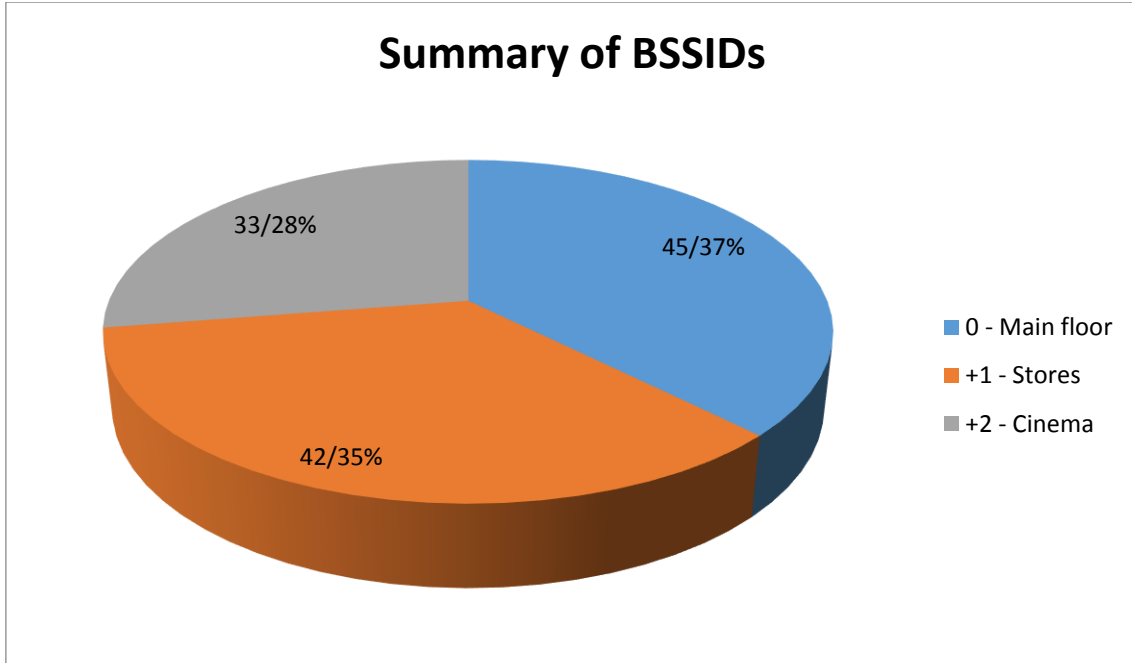

The following graph shows the total number and the percentage of networks detected at each location.

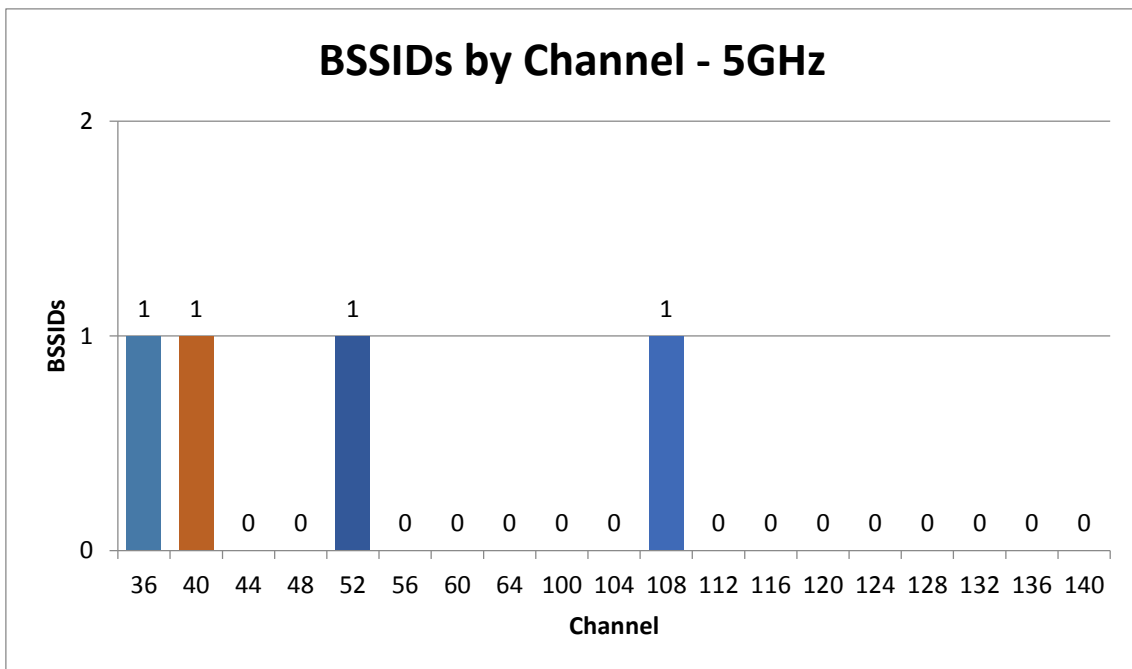

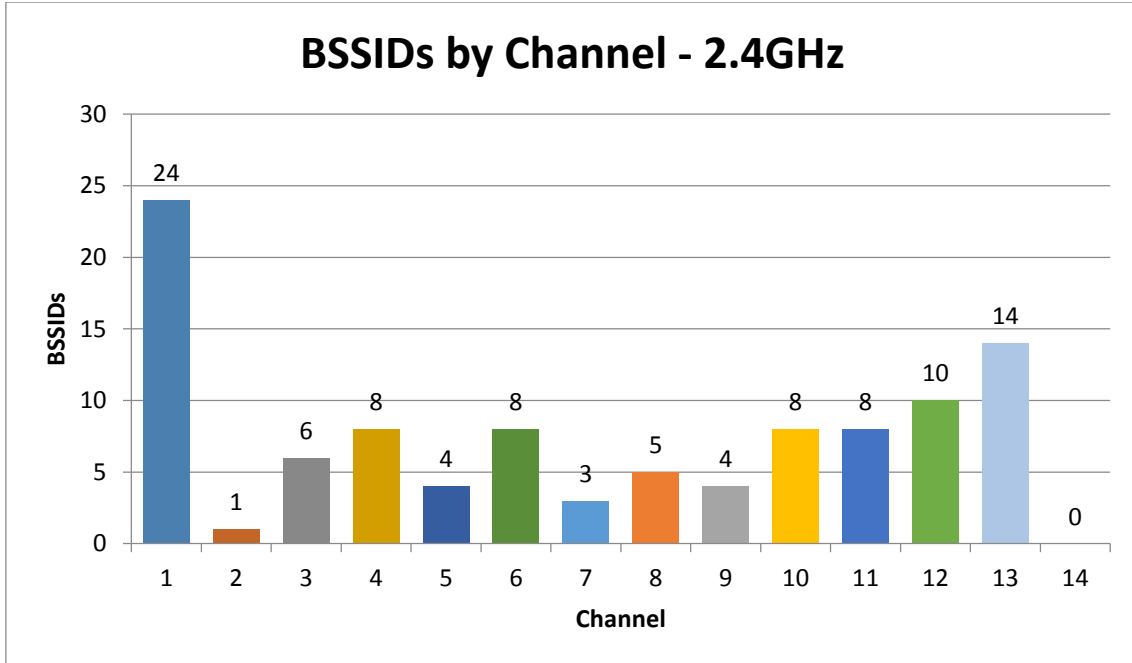

The following graph shows the total number and the percentage of physical APs detected at each location.

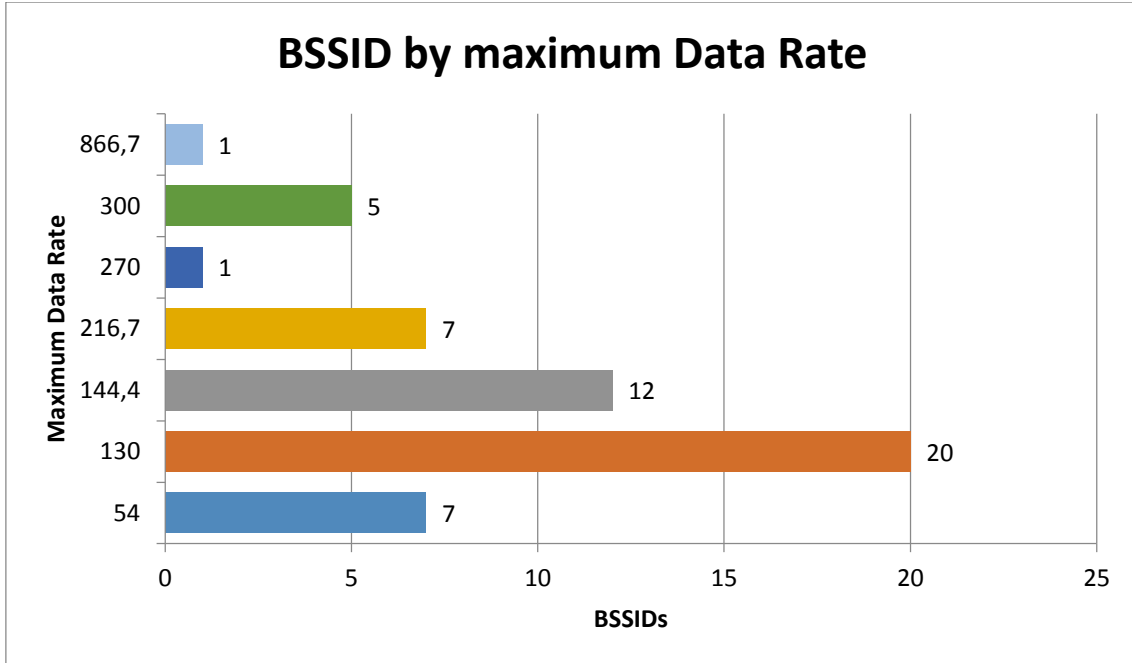

The following graph shows the total number and the percentage of BSSIDs detected at each location.

The following two graphs show the number of BSSIDs detected at each Channel, in the 2.4GHz bandwidth and in the 5GHz bandwidth respectively.

The following graph shows the number of BSSIDs detected, ordered by maximum Data Rate registered value.

## 2. NETWORKS

The following table contains relevant information about all the networks detected during the survey:

- SSID: Network identifier offered by the BSSID.
- BSSID: Unique device identifier (Basic Service Set Identifier)
- Channel: Identifier of the frequency on which the network is operating.
- Frequency: Value of frequency in which the network channel is operating, expressed in Mhz.
- Average RSSI: Average Signal Strength detected on each device during the survey.
- Maximum RSSI: Maximum Signal Strength detected on each device during the survey.
- Minimum RSSI: Minimum Signal Strength detected on each device during the survey.
- Security: Types of authentication and encryption supported by the network.
- WPS: Wi-Fi Protected Setup version supported by the network.

	SSID	BSSID	CHAN	FREQ	RSSI AVG	RSSI MAX	RSSI MIN	SECURITY	WPS

### 3. ACCESS POINTS

This section shows information about the physical access points detected during a survey, grouping all BSSIDs that are managed by the same physical device, as well as the number of clients connected to each one of them during the survey.

For each physical access point, its manufacturer is shown, as well as all its managed networks.

For each physical access point:

- BSSID: Associated MAC addresses granting network access.
- SSID: Network identifier offered by the BSSID.
- Channel: Identifier of the frequency associated to the network.
- Frequency: Value of the frequency associated to the network.
- Clients: Number of connected clients (if monitoring is performed on Monitor Mode or Aircap)

## 4.2. NETWORK SURVEY: ASCANCELAS

### 4.2.1. NETWORK DETAILS

#### 4.2.1.1. AP-BASED INFORMATION

The following table contains information related to the **AsCancelas** network, which is organized based on its APs:

- SSID: Network identifier offered by the BSSID.
- BSSID: Associated MAC addresses granting network access.
- Channel: Identifier of the frequency associated to the network.
- Frequency: Value of the frequency associated to the network.
- Security: Types of authentication and encryption supported by the network.
- Vendor: Device manufacturer.

	SSID	ASCANCELAS			
	BSSID	CHANNEL	FREQ	SECURITY	VENDOR
1	04:BD:88:F0:7E:A0	6	2437	Open	Aruba Networks
2	04:BD:88:F0:D2:C0	1	2412	Open	Aruba Networks

23	24:DE:C6:91:AE:52	11	2462	Open	Aruba Networks

#### 4.2.1.2. CHANNEL-BASED INFORMATION

The following table contains **AsCancelas** network related information, which is organized based on the transmitting channels/frequencies:

- SSID: Network identifier offered by the BSSID.
- Channel: Identifier of the frequency associated to the network.
- Frequency: Value of the frequency associated to the network.
- BSSID: Associated MAC addresses granting network access.
- Vendor: Device manufacturer.

SSID	ASCANCELAS

#### 4.2.1.3. "AsCancelas" ACCESS POINT POSITION

The following image shows the approximate positions of all access points identified during the site survey which are publishing the network **AsCancelas**. These positions are manually configured, or otherwise are automatically estimated based on the measured data.

Physical APs Position for AsCancelas Network

	BSSID	SSID	VENDOR	CHAN
1	24:DE:C6:81:0E:02	AsCancelas	Aruba Networks	9
2	24:DE:C6:81:0E:52	AsCancelas	Aruba Networks	1
3	24:DE:C6:81:0E:B2	AsCancelas	Aruba Networks	12
4	24:DE:C6:81:0F:A2	AsCancelas	Aruba Networks	10
5	04:BD:88:F1:03:A0	AsCancelas	Aruba Networks	1
6	04:BD:88:F1:02:80	AsCancelas	Aruba Networks	1
7	04:BD:88:F0:E1:80	AsCancelas	Aruba Networks	6
8	04:BD:88:F0:7E:A0	AsCancelas	Aruba Networks	6

**4.2.2. WiFi QUALITY**

**4.2.2.1. WEB BROWSING WiFi REQUIREMENTS**

**4.2.2.1.1. RSSI COVERAGE**

The Rssi Coverage control displays those areas where the signal strength received from any of the selected access points falls below the selected threshold value. Signal strength has a significant impact on the quality of communications. Signal strength is measured in dBm, and ranges from 0 dBm (stronger) to -100 dBm (weaker).

Acceptable values range from 0 to -75 dBm. Proper communication cannot be guaranteed with lower signal strength values.

RSSI Coverage for the network AsCancelas

Pass	RSSI Required greater than or equal -65 dBm
Fail	

#### 4.2.2.1.2. SIMULTANEOUS RSSI COVERAGE

The Simultaneous AP Coverage control displays those areas where signal strength received by any of the network access points is equal or lower than the predetermined threshold value.

To ensure dependable wireless communications, it is necessary, under certain circumstances, that all the points in the coverage area can access a certain number of access points within the network infrastructure, preventing channel overlapping, with at least a minimum signal strength.

Simultaneous RSSI Coverage for the network AsCancelas

<b>Pass</b>	RSSI Required greater than or equal -65 dBm Simultaneous APs Required greater than or equal 2 APs
<b>Fail</b>	

#### 4.2.2.1.3. CHANNEL OVERLAP

The Channel Overlapping control shows those areas where adjacent interference requirements are met.

An AP is considered to have an adjacent interference when some of its transmitted frequencies overlap with another AP transmitting on a different channel over the same band.

Channel Overlap for the network AsCancelas

Pass	AP Overlap less than or equal 0 APs Gap RSSI greater than or equal 20 dBm
Fail	

#### 4.2.2.1.4. CO-CHANNEL INTERFERENCE

This control displays those areas where co-channel interference parameters are met.

An AP is considered to have a co-channel interference when there is another AP transmitting on the same channel.

As a consequence of channel overlap, access points occupy the same radio spectrum, sharing it and using it alternately, so only one AP will be transmitting at a time.

This kind of interferences worsen communications performance because it is necessary to analyse wireless space before transmitting. If one AP is transmitting, others must wait for this to stop before they can transmit. This makes total transmission time to be divided into the number of APs that transmit in the same frequency.

Co-Channel Interference for the network AsCancelas

Pass	Overlapping APs less than or equal 1 APs
Fail	Gap RSSI greater than or equal 20 dBm

#### 4.2.2.1.5. LATENCY

Latency is the time interval between sending a data packet and receiving it back, in this case, latency is the amount of time a packet takes to be transmitted and received back in the wireless space.

Acceptable latency values range from 1-10ms.

Latency for the network AsCancelas

Pass	Network Latency less than or equal 100ms
Fail	

#### 4.2.2.1.6. BANDWIDTH

The Bandwidth control ensures that minimum bandwidth quality requirements for the connection established by the active survey are met throughout the coverage area.

Bandwidth for the network AsCancelas

Pass	Bandwidth greater than or equal 320 kbps
Fail	

#### 4.2.2.1.7. PACKET LOST

The packet loss rate is the percentage of packets that are lost, in other words, that do not reach their destination at the time of establishing communication, and that are (usually) retransmitted. Packet loss has a negative impact on network performance. When a packet does not reach its destination, packet retransmission is usually requested by the recipient to keep communication flowing normally.

Packet loss rates of under 10% are acceptable and will have a negligible impact on network performance in most cases.

Packet Lost for the network AsCancelas

Pass	Ratio Lost less than or equal 25%
Fail	

#### 4.2.2.1.8. ACCESS POINT ROAMING

The Roaming control shows those areas where Roaming is required by extending network coverage through many different access points. In a wireless infrastructure, multiple access points are deployed to provide coverage throughout the desired area.

Roaming allows moving devices to maintain wireless communication by connecting to new access points within the same network to maintain the quality of communication and prevent degradation of signal strength. This service is called Roaming

Access Point Roaming for the network AsCancelas

**4.2.2.2. VOIP OVER WiFi REQUIREMENTS**

**4.2.2.2.1. RSSI COVERAGE**

The Rssi Coverage control displays those areas where the signal strength received from any of the selected access points falls below the selected threshold value. Signal strength has a significant impact on the quality of communications. Signal strength is measured in dBm, and ranges from 0 dBm (stronger) to -100 dBm (weaker).

Acceptable values range from 0 to -75 dBm. Proper communication cannot be guaranteed with lower signal strength values.

RSSI Coverage for the network AsCancelas

Pass	RSSI Required greater than or equal -50 dBm
Fail	

#### 4.2.2.2.2. SIMULTANEOUS RSSI COVERAGE

The Simultaneous AP Coverage control displays those areas where signal strength received by any of the network access points is equal or lower than the predetermined threshold value.

To ensure dependable wireless communications, it is necessary, under certain circumstances, that all the points in the coverage area can access a certain number of access points within the network infrastructure, preventing channel overlapping, with at least a minimum signal strength.

Simultaneous RSSI Coverage for the network AsCancelas

Pass	RSSI Required greater than or equal -45 dBm
Fail	Simultaneous APs Required greater than or equal 5 APs

#### 4.2.2.2.3. CHANNEL OVERLAP

The Channel Overlapping control shows those areas where adjacent interference requirements are met.

An AP is considered to have an adjacent interference when some of its transmitted frequencies overlap with another AP transmitting on a different channel over the same band.

Channel Overlap for the network AsCancelas

Pass	AP Overlap less than or equal 0 APs Gap RSSI greater than or equal 20 dBm
Fail	

#### 4.2.2.2.4. CO-CHANNEL INTERFERENCE

This control displays those areas where co-channel interference parameters are met.

An AP is considered to have a co-channel interference when there is another AP transmitting on the same channel.

As a consequence of channel overlap, access points occupy the same radio spectrum, sharing it and using it alternately, so only one AP will be transmitting at a time.

This kind of interferences worsen communications performance because it is necessary to analyse wireless space before transmitting. If one AP is transmitting, others must wait for this to stop before they can transmit. This makes total transmission time to be divided into the number of APs that transmit in the same frequency.

Co-Channel Interference for the network AsCancelas

Pass	Overlapping APs less than or equal 1 APs Gap RSSI greater than or equal 20 dBm
Fail	

#### 4.2.2.2.5. LATENCY

Latency is the time interval between sending a data packet and receiving it back, in this case, latency is the amount of time a packet takes to be transmitted and received back in the wireless space.

Acceptable latency values range from 1-10ms.

Latency for the network AsCancelas

Pass	Network Latency less than or equal 256ms
Fail	

#### 4.2.2.2.6. BANDWIDTH

The Bandwidth control ensures that minimum bandwidth quality requirements for the connection established by the active survey are met throughout the coverage area.

Bandwidth for the network AsCancelas

Pass	Bandwidth greater than or equal 5000 kbps
Fail	

#### 4.2.2.2.7. PACKET LOST

The packet loss rate is the percentage of packets that are lost, in other words, that do not reach their destination at the time of establishing communication, and that are (usually) retransmitted. Packet loss has a negative impact on network performance. When a packet does not reach its destination, packet retransmission is usually requested by the recipient to keep communication flowing normally.

Packet loss rates of under 10% are acceptable and will have a negligible impact on network performance in most cases.

Packet Lost for the network AsCancelas

Pass	Ratio Lost less than or equal 25%
Fail	

#### 4.2.2.2.8. ACCESS POINT ROAMING

The Roaming control shows those areas where Roaming is required by extending network coverage through many different access points. In a wireless infrastructure, multiple access points are deployed to provide coverage throughout the desired area.

Roaming allows moving devices to maintain wireless communication by connecting to new access points within the same network to maintain the quality of communication and prevent degradation of signal strength. This service is called Roaming

Access Point Roaming for the network AsCancelas

### 4.2.3. SURVEY

#### 4.2.3.1. RSSI HEATMAP

Signal Strength translates as how efficiently the network is reaching the surveyed area, indicating how the **AsCancelas** network is received at each location.

Signal strength values range from 0 db to -100db, being -100db the worse performance. The color scheme is shown below the image.

Signal Strength Heatmap for AsCancelas Network

**Network coverage area\* 8077 m2**

\*This information indicates the network coverage area at a signal strength of at least:-75

#### 4.2.3.2. RSSI DETAILED BY AP

The following table contains a tile view of all BSSIDs associated to the **AsCancelas** network, along with its signal strength heatmap, associated covered area, and device manufacturer.

<p>No Signal Strength data over RSSI = -75</p>	<p>No Signal Strength data over RSSI = -75</p>

#### 4.2.3.3. RSSI DETAILED BY CHANNEL

The following table contains a tile view of all operative channels on the **AsCancelas** network.

The graph shows the signal strength heatmap, and the coverage area associated with this network on that channel.

Coverage area: 3882 m2

Coverage area: 2 m2

Coverage area: 2804 m2

10 Channel 13

Coverage area: 7312 m2

**4.2.3.4. NUMBER OF APs**

The following image shows the number of access points granting access to the **AsCancelas** network that were detected within the surveyed area.

The graph reveals the existing signal overlapping from the different access points granting access to the same network.

**Number of APs for AsCancelas Network**

#### 4.2.3.5. AP COVERAGE

The following image shows the color coded coverage of every AP propagating the **AsCancelas** network.

If coverage from two or more channels overlap throughout the surveyed area, then the stronger signal channel is display.

Using this graph, you will be able to analyze the appropriate coverage distribution.

AP Coverage for AsCancelas Network

Access Point		Access Point		Access Point	
	04:BD:88:F0:7E:A0		04:BD:88:F0:D2:C0		04:BD:88:F0:E1:00

**4.2.3.6. CHANNEL COVERAGE**

The following image shows the coverage range for every channel in the **AsCancelas** network.

If coverage from two or more channels overlap throughout the surveyed area, then the stronger signal channel is display.

Channel Coverage for AsCancelas Network.

**4.2.3.7. CHANNEL OVERLAP**

The following image shows the coverage area for each operative channel on the **AsCancelas** network, and the signal overlapping between two or more channels throughout the surveyed area.

Channel Overlap for AsCancelas Network

**4.2.3.8. DETAILED GRID**

In the following image, the blueprint associated to the surveyed area is divided into quadrants. Each quadrant shows the collected information in that grid.

Detailed Grid for AsCancelas Location

	SURVEY POINTS	BEST RSSI	AVG RSSI	NETWORKS (SSIDs)	APs	DATA RATE (MAX)
D0	13	-49	-73	AsCancelas	8	216,7

#### **4.2.3.9. SNR HEATMAP**

The following image shows the **AsCancelas** network's signal-to-noise ratio throughout the surveyed area.

Signal-to-noise ratio measures the ratio between the Wi-Fi network signal strength and the background noise. Higher noise levels will result in a larger negative impact on communications. This parameter offers valuable information on the effectiveness of communications. These values range from 0 to 100, being 100 the best possible communication quality.

*The graph can't be generated due to the absence of the required data.*

#### 4.2.3.10. DATA RATE HEATMAP

The following image shows the area covered by the APs based on their data transfer rates for the **AsCancelas** network throughout the surveyed area.

Data rate helps determine the maximum data transmission speed among the wireless devices connected to a Wi-Fi network.

This value allows you to establish how consistent a network is when transmitting data across the coverage area, and helps you find those areas where these values greatly differ or the network performance significantly decreases.

Data Rate for AsCancelas Network

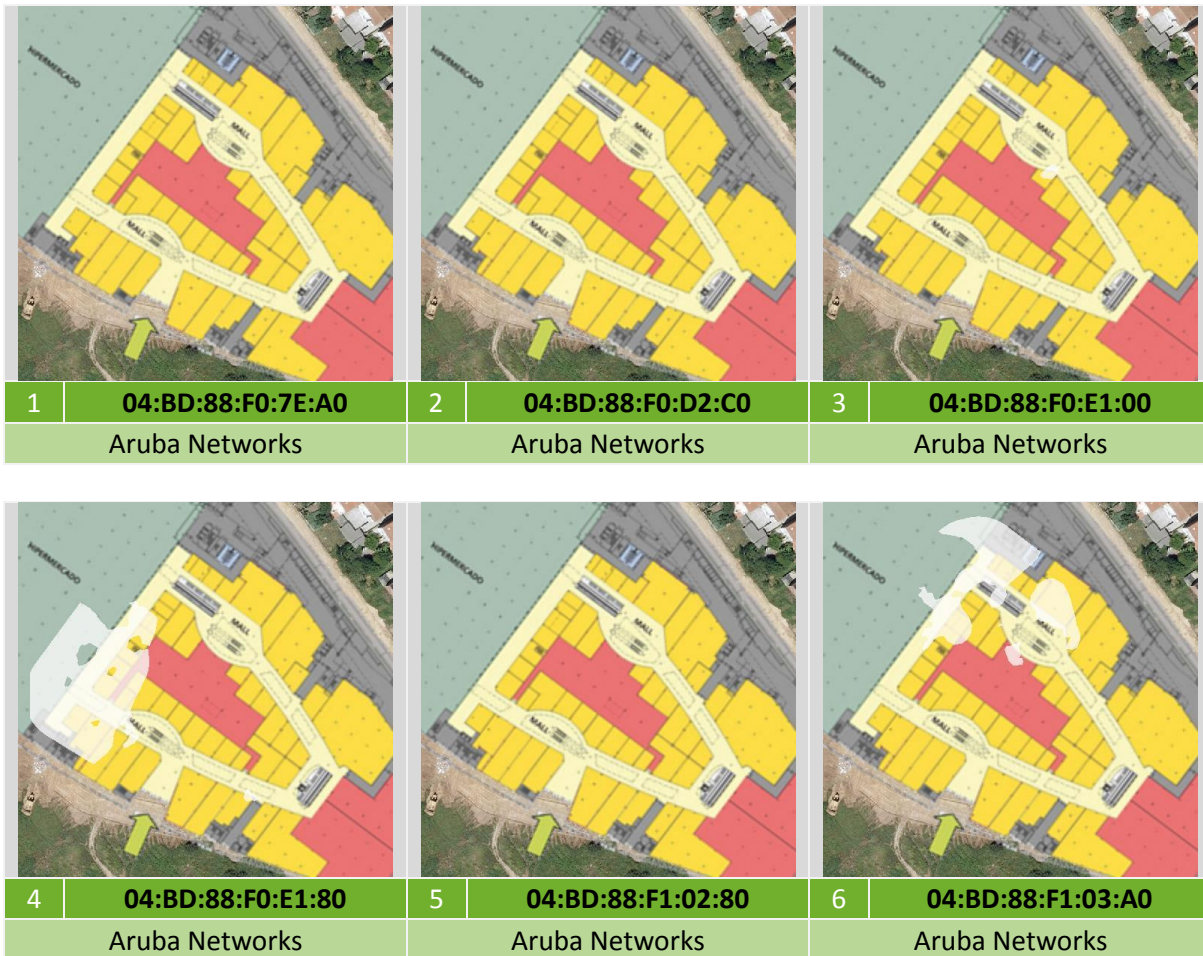

#### 4.2.3.11. DATA RATE DETAILED

The following table shows a tile view of all BSSIDs associated with the **AsCancelas** network, together with the graph indicating the covered area and the maximum supported data transfer rate speed.

Data rate helps determine the maximum data transmission speed between the wireless devices connected to a Wi-Fi network.

It allows you to determine how efficiently a network transmits data throughout a certain area, and if there are blind zones where reduced network performance is observed.

#### **4.2.3.12. CELL DENSITY HEATMAP**

The following image shows a heatmap revealing the distribution of all client devices connected to the APs propagating the **AsCancelas** network.

Cell density allows you to spot which zones have the higher number of client devices connected to the network by showing its saturation.

It provides useful information to allow for an even AP distribution according to actual usage.

*The graph can't be generated due to the absence of the required data.*

#### **4.2.3.13. RETRIES RATE HEATMAP**

In an ideal Wi-Fi communication, all sent data packets reach their destination. Otherwise, poor transmission, interferences or any other communication problems can cause the dropped packets to be retransmitted for a correct data transmission. The larger the number of retransmitted or forwarded packets, the larger the communication latency will be, resulting in a lower communication quality.

*The graph can't be generated due to the absence of the required data.*

**BANDWIDTH**

Bandwidth indicates the amount of data being transmitted through **AsCancelas** network for each area within the network site range.

Bandwidth is measured in kilobytes per seconds, KB/s (1MB/s=1000KB/s), where a higher value translates as a better network performance.

Bandwidth for the network AsCancelas

#### 4.2.3.14. LATENCY

Latency indicates the time delay experienced in the data transfer through **AsCancelas** network for each area within the network site range.

When a data packet is sent, it is received by a receiving device that notifies the transmitting device that the packet has been successfully received. Latency is the period from the time a data packet is sent to the time the packet reception confirmation is received. Latency is measured in milliseconds (ms).

The higher the latency, the lowest the network performance will be. High latency values negatively impact real-time application performance, such as video-conferencing and VoIP communications.

Latency for the network AsCancelas

#### 4.2.3.15. PACKET LOSS

In an ideal data communication, all sent data packets reach their destination; otherwise there is a packet loss that negatively impacts the data transmission performance, hence the overall network performance.

When a data packet is lost, if required by the protocol, it should be re-transmitted until a successful reception notification is received. This increases the amount of time necessary for a data unit to be transmitted, reducing the amount of data that can be transmitted per unit of time. The higher this value is, the lower the network performance will be.

The following image shows the areas where data packet loss is experienced within **AsCancelas** network site range.

Packet Loss for the network AsCancelas

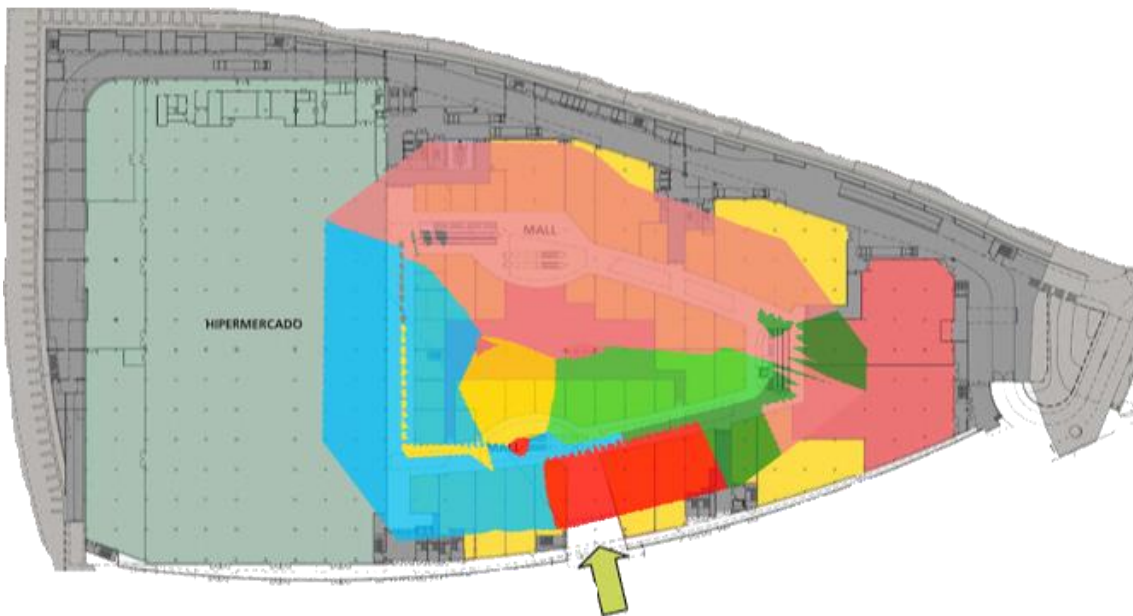

#### 4.2.3.16. ROAMING

Data roaming in a Wi-Fi network infrastructure is the ability of a client device to move around within a multiple access point network's coverage area without disconnections.

To ensure roaming in a multiple access point Wi-Fi network, access points' coverage ranges should overlap.

Accordingly, a moving client device will have continuous network coverage, and based on the device's internal settings and access point configuration, network access will be granted through the different access points across the coverage area.

The following image shows all **AsCancelas** network access points to which the device has been connected to while itinerating.

Roaming for the network AsCancelas

## 5.2. NETWORK SURVEY: ASCANCELAS

### 5.2.1. NETWORK DETAILS

#### 5.2.1.1. AP-BASED INFORMATION

The following table contains information related to the **AsCancelas** network, which is organized based on its APs:

- SSID: Network identifier offered by the BSSID.
- BSSID: Associated MAC addresses granting network access.
- Channel: Identifier of the frequency associated to the network.
- Frequency: Value of the frequency associated to the network.
- Security: Types of authentication and encryption supported by the network.
- Vendor: Device manufacturer.

	SSID	ASCANCELAS			
	BSSID	CHANNEL	FREQ	SECURITY	VENDOR
1	04:BD:88:F0:7E:A0	6	2437	Open	Aruba Networks

### 5.2.1.2. CHANNEL-BASED INFORMATION

The following table contains **AsCancelas** network related information, which is organized based on the transmitting channels/frequencies:

- SSID: Network identifier offered by the BSSID.
- Channel: Identifier of the frequency associated to the network.
- Frequency: Value of the frequency associated to the network.
- BSSID: Associated MAC addresses granting network access.
- Vendor: Device manufacturer.

SSID	ASCANCELAS		
CHANNEL	FREQUENCY	BSSID	VENDOR
1	2412	24:DE:C6:81:0B:E2	Aruba Networks

**5.2.1.3. "ASCANCELAS" ACCESS POINT POSITION**

The following image shows the approximate positions of all access points identified during the site survey which are publishing the network **AsCancelas**. These positions are manually configured, or otherwise are automatically estimated based on the measured data.

**Physical APs Position for AsCancelas Network**

	BSSID	SSID	VENDOR	CHAN
1	24:DE:C6:81:0B:B2	AsCancelas	Aruba Networks	8
2	24:DE:C6:81:0B:E2	AsCancelas	Aruba Networks	5
3	24:DE:C6:81:1C:32	AsCancelas	Aruba Networks	12
4	24:DE:C6:81:58:12	AsCancelas	Aruba Networks	10
5	24:DE:C6:81:12:12	AsCancelas	Aruba Networks	13
6	24:DE:C6:81:0C:82	AsCancelas	Aruba Networks	13
7	24:DE:C6:81:0C:72	AsCancelas	Aruba Networks	4
8	24:DE:C6:81:0F:02	AsCancelas	Aruba Networks	13
9	04:BD:88:F0:A1:E0	AsCancelas	Aruba Networks	1

**5.2.2. WiFi QUALITY**

**5.2.2.1. WEB BROWSING WiFi REQUIREMENTS**

**5.2.2.1.1. RSSI COVERAGE**

The Rssi Coverage control displays those areas where the signal strength received from any of the selected access points falls below the selected threshold value. Signal strength has a significant impact on the quality of communications. Signal strength is measured in dBm, and ranges from 0 dBm (stronger) to -100 dBm (weaker).

Acceptable values range from 0 to -75 dBm. Proper communication cannot be guaranteed with lower signal strength values.

RSSI Coverage for the network AsCancelas

Pass	RSSI Required greater than or equal -65 dBm
Fail	

### 5.2.2.1.2. SIMULTANEOUS RSSI COVERAGE

The Simultaneous AP Coverage control displays those areas where signal strength received by any of the network access points is equal or lower than the predetermined threshold value.

To ensure dependable wireless communications, it is necessary, under certain circumstances, that all the points in the coverage area can access a certain number of access points within the network infrastructure, preventing channel overlapping, with at least a minimum signal strength.

Simultaneous RSSI Coverage for the network AsCancelas

<b>Pass</b>	RSSI Required greater than or equal -65 dBm
<b>Fail</b>	Simultaneous APs Required greater than or equal 2 APs

### 5.2.2.1.3. CHANNEL OVERLAP

The Channel Overlapping control shows those areas where adjacent interference requirements are met.

An AP is considered to have an adjacent interference when some of its transmitted frequencies overlap with another AP transmitting on a different channel over the same band.

Channel Overlap for the network AsCancelas

Pass	AP Overlap less than or equal 0 APs Gap RSSI greater than or equal 20 dBm
Fail	

#### 5.2.2.1.4. CO-CHANNEL INTERFERENCE

This control displays those areas where co-channel interference parameters are met.

An AP is considered to have a co-channel interference when there is another AP transmitting on the same channel.

As a consequence of channel overlap, access points occupy the same radio spectrum, sharing it and using it alternately, so only one AP will be transmitting at a time.

This kind of interferences worsen communications performance because it is necessary to analyse wireless space before transmitting. If one AP is transmitting, others must wait for this to stop before they can transmit. This makes total transmission time to be divided into the number of APs that transmit in the same frequency.

Co-Channel Interference for the network AsCancelas

<b>Pass</b>	Overlapping APs less than or equal 1 APs Gap RSSI greater than or equal 20 dBm
<b>Fail</b>	

### 5.2.2.1.5. LATENCY

Latency is the time interval between sending a data packet and receiving it back, in this case, latency is the amount of time a packet takes to be transmitted and received back in the wireless space.

Acceptable latency values range from 1-10ms.

Latency for the network AsCancelas

Pass	Network Latency less than or equal 100ms
Fail	

### 5.2.2.1.6. BANDWIDTH

The Bandwidth control ensures that minimum bandwidth quality requirements for the connection established by the active survey are met throughout the coverage area.

Bandwidth for the network AsCancelas

Pass	Bandwidth greater than or equal 320 kbps
Fail	

### 5.2.2.1.7. PACKET LOST

The packet loss rate is the percentage of packets that are lost, in other words, that do not reach their destination at the time of establishing communication, and that are (usually) retransmitted. Packet loss has a negative impact on network performance. When a packet does not reach its destination, packet retransmission is usually requested by the recipient to keep communication flowing normally.

Packet loss rates of under 10% are acceptable and will have a negligible impact on network performance in most cases.

Packet Lost for the network AsCancelas

Pass	Ratio Lost less than or equal 25%
Fail	

#### 5.2.2.1.8. ACCESS POINT ROAMING

The Roaming control shows those areas where Roaming is required by extending network coverage through many different access points. In a wireless infrastructure, multiple access points are deployed to provide coverage throughout the desired area. Roaming allows moving devices to maintain wireless communication by connecting to new access points within the same network to maintain the quality of communication and prevent degradation of signal strength. This service is called Roaming

Access Point Roaming for the network AsCancelas

**5.2.2.2. VOIP OVER WiFi REQUIREMENTS**

**5.2.2.2.1. RSSI COVERAGE**

The Rssi Coverage control displays those areas where the signal strength received from any of the selected access points falls below the selected threshold value. Signal strength has a significant impact on the quality of communications. Signal strength is measured in dBm, and ranges from 0 dBm (stronger) to -100 dBm (weaker).

Acceptable values range from 0 to -75 dBm. Proper communication cannot be guaranteed with lower signal strength values.

RSSI Coverage for the network AsCancelas

Pass	RSSI Required greater than or equal -50 dBm
Fail	

#### 5.2.2.2.2. SIMULTANEOUS RSSI COVERAGE

The Simultaneous AP Coverage control displays those areas where signal strength received by any of the network access points is equal or lower than the predetermined threshold value.

To ensure dependable wireless communications, it is necessary, under certain circumstances, that all the points in the coverage area can access a certain number of access points within the network infrastructure, preventing channel overlapping, with at least a minimum signal strength.

Simultaneous RSSI Coverage for the network AsCancelas

<b>Pass</b>	RSSI Required greater than or equal -45 dBm
<b>Fail</b>	Simultaneous APs Required greater than or equal 5 APs

### 5.2.2.2.3. CHANNEL OVERLAP

The Channel Overlapping control shows those areas where adjacent interference requirements are met.

An AP is considered to have an adjacent interference when some of its transmitted frequencies overlap with another AP transmitting on a different channel over the same band.

Channel Overlap for the network AsCancelas

Pass	AP Overlap less than or equal 0 APs Gap RSSI greater than or equal 20 dBm
Fail	

#### 5.2.2.2.4. CO-CHANNEL INTERFERENCE

This control displays those areas where co-channel interference parameters are met.

An AP is considered to have a co-channel interference when there is another AP transmitting on the same channel.

As a consequence of channel overlap, access points occupy the same radio spectrum, sharing it and using it alternately, so only one AP will be transmitting at a time.

This kind of interferences worsen communications performance because it is necessary to analyse wireless space before transmitting. If one AP is transmitting, others must wait for this to stop before they can transmit. This makes total transmission time to be divided into the number of APs that transmit in the same frequency.

Co-Channel Interference for the network AsCancelas

Pass	Overlapping APs less than or equal 1 APs Gap RSSI greater than or equal 20 dBm
Fail	

#### 5.2.2.2.5. LATENCY

Latency is the time interval between sending a data packet and receiving it back, in this case, latency is the amount of time a packet takes to be transmitted and received back in the wireless space.

Acceptable latency values range from 1-10ms.

Latency for the network AsCancelas

Pass	Network Latency less than or equal 256ms
Fail	

#### 5.2.2.2.6. BANDWIDTH

The Bandwidth control ensures that minimum bandwidth quality requirements for the connection established by the active survey are met throughout the coverage area.

Bandwidth for the network AsCancelas

Pass	Bandwidth greater than or equal 5000 kbps
Fail	

### 5.2.2.2.7. PACKET LOST

The packet loss rate is the percentage of packets that are lost, in other words, that do not reach their destination at the time of establishing communication, and that are (usually) retransmitted. Packet loss has a negative impact on network performance. When a packet does not reach its destination, packet retransmission is usually requested by the recipient to keep communication flowing normally.

Packet loss rates of under 10% are acceptable and will have a negligible impact on network performance in most cases.

Packet Lost for the network AsCancelas

Pass	Ratio Lost less than or equal 25%
Fail	

#### 5.2.2.2.8. ACCESS POINT ROAMING

The Roaming control shows those areas where Roaming is required by extending network coverage through many different access points. In a wireless infrastructure, multiple access points are deployed to provide coverage throughout the desired area.

Roaming allows moving devices to maintain wireless communication by connecting to new access points within the same network to maintain the quality of communication and prevent degradation of signal strength. This service is called Roaming

Access Point Roaming for the network AsCancelas

**5.2.3. SURVEY**

**5.2.3.1. RSSI HEATMAP**

Signal Strength translates as how efficiently the network is reaching the surveyed area, indicating how the **AsCancelas** network is received at each location.

Signal strength values range from 0 db to -100db, being -100db the worse performance. The color scheme is shown below the image.

Signal Strength Heatmap for AsCancelas Network

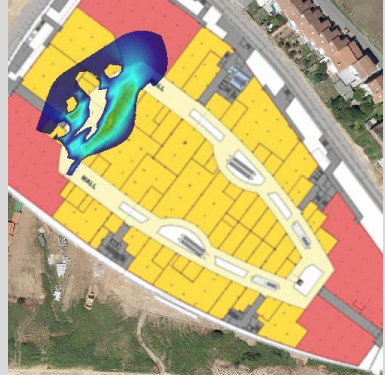

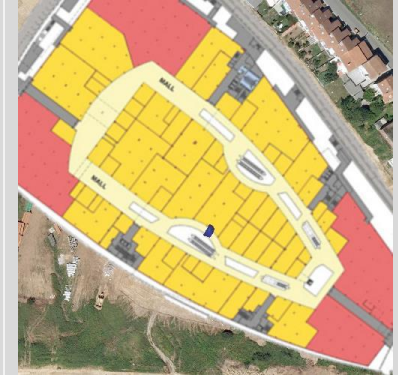

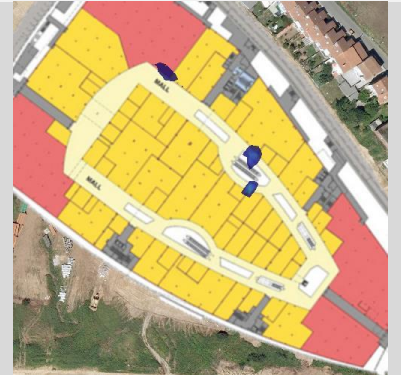

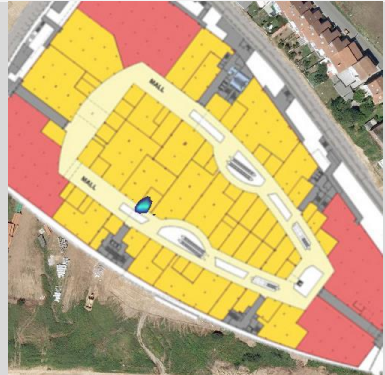

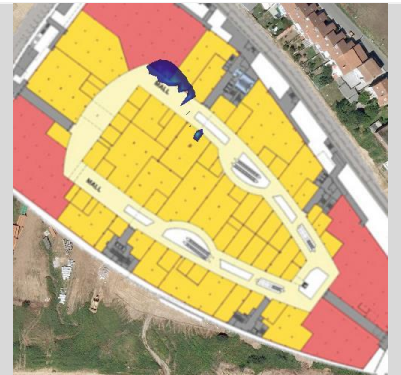

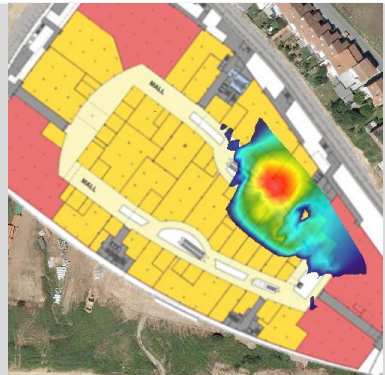

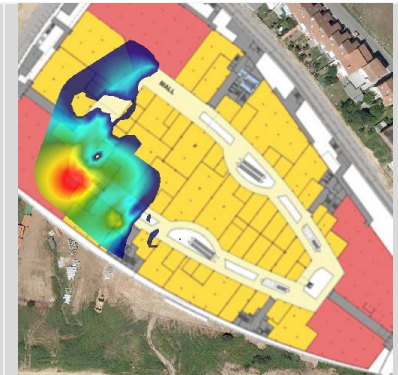

**Network coverage area\* 9162 m2**

\*This information indicates the network coverage area at a signal strength of at least:-75

### 5.2.3.2. RSSI DETAILED BY AP

The following table contains a tile view of all BSSIDs associated to the **AsCancelas** network, along with its signal strength heatmap, associated covered area, and device manufacturer.

**5.2.3.3. RSSI DETAILED BY CHANNEL**

The following table contains a tile view of all operative channels on the **AsCancelas** network.

The graph shows the signal strength heatmap, and the coverage area associated with this network on that channel.

Coverage area: 4266 m2

Coverage area: 0 m2

Coverage area: 4065 m2

10 | **Channel 13**

Coverage area: 8056 m2

**5.2.3.4. NUMBER OF APs**

The following image shows the number of access points granting access to the **AsCancelas** network that were detected within the surveyed area.

The graph reveals the existing signal overlapping from the different access points granting access to the same network.

**Number of APs for AsCancelas Network**

### 5.2.3.5. AP COVERAGE

The following image shows the color coded coverage of every AP propagating the **AsCancelas** network.

If coverage from two or more channels overlap throughout the surveyed area, then the stronger signal channel is display.

Using this graph, you will be able to analyze the appropriate coverage distribution.

AP Coverage for AsCancelas Network

Access Point		Access Point		Access Point	
	04:BD:88:F0:7E:A0		04:BD:88:F0:A1:E0		04:BD:88:F0:D2:C0
	04:BD:88:F0:E1:00		04:BD:88:F0:E1:80		04:BD:88:F1:02:80

**5.2.3.6. CHANNEL COVERAGE**

The following image shows the coverage range for every channel in the **AsCancelas** network.

If coverage from two or more channels overlap throughout the surveyed area, then the stronger signal channel is display.

Channel Coverage for AsCancelas Network.

**5.2.3.7. CHANNEL OVERLAP**

The following image shows the coverage area for each operative channel on the **AsCancelas** network, and the signal overlapping between two or more channels throughout the surveyed area.

Channel Overlap for AsCancelas Network

**5.2.3.8. DETAILED GRID**

In the following image, the blueprint associated to the surveyed area is divided into quadrants. Each quadrant shows the collected information in that grid.

Detailed Grid for AsCancelas Location

	SURVEY POINTS	BEST RSSI	AVG RSSI	NETWORKS (SSIDs)	APs	DATA RATE (MAX)
C0	28	-42	-67	AsCancelas	9	216,7
D0	23	-36	-68	AsCancelas	9	216,7
A1	1	-61	-62	AsCancelas	2	130

J7	1	-60	-71	AsCancelas	3	216,7

#### **5.2.3.9. SNR HEATMAP**

The following image shows the **AsCancelas** network's signal-to-noise ratio throughout the surveyed area.

Signal-to-noise ratio measures the ratio between the Wi-Fi network signal strength and the background noise. Higher noise levels will result in a larger negative impact on communications. This parameter offers valuable information on the effectiveness of communications. These values range from 0 to 100, being 100 the best possible communication quality.

*The graph can't be generated due to the absence of the required data.*

### 5.2.3.10. DATA RATE HEATMAP

The following image shows the area covered by the APs based on their data transfer rates for the **AsCancelas** network throughout the surveyed area.

Data rate helps determine the maximum data transmission speed among the wireless devices connected to a Wi-Fi network.

This value allows you to establish how consistent a network is when transmitting data across the coverage area, and helps you find those areas where these values greatly differ or the network performance significantly decreases.

Data Rate for AsCancelas Network

**5.2.3.11. DATA RATE DETAILED**

The following table shows a tile view of all BSSIDs associated with the **AsCancelas** network, together with the graph indicating the covered area and the maximum supported data transfer rate speed.

Data rate helps determine the maximum data transmission speed between the wireless devices connected to a Wi-Fi network.

It allows you to determine how efficiently a network transmits data throughout a certain area, and if there are blind zones where reduced network performance is observed.

#### **5.2.3.12. CELL DENSITY HEATMAP**

The following image shows a heatmap revealing the distribution of all client devices connected to the APs propagating the **AsCancelas** network.

Cell density allows you to spot which zones have the higher number of client devices connected to the network by showing its saturation.

It provides useful information to allow for an even AP distribution according to actual usage.

*The graph can't be generated due to the absence of the required data.*

### **5.2.3.13. RETRIES RATE HEATMAP**

In an ideal Wi-Fi communication, all sent data packets reach their destination. Otherwise, poor transmission, interferences or any other communication problems can cause the dropped packets to be retransmitted for a correct data transmission. The larger the number of retransmitted or forwarded packets, the larger the communication latency will be, resulting in a lower communication quality.

*The graph can't be generated due to the absence of the required data.*

#### 5.2.3.14. BANDWIDTH

Bandwidth indicates the amount of data being transmitted through **AsCancelas** network for each area within the network site range.

Bandwidth is measured in kilobytes per seconds, KB/s (1MB/s=1000KB/s), where a higher value translates as a better network performance.

Bandwidth for the network AsCancelas

### 5.2.3.15. LATENCY

Latency indicates the time delay experienced in the data transfer through **AsCancelas** network for each area within the network site range.

When a data packet is sent, it is received by a receiving device that notifies the transmitting device that the packet has been successfully received. Latency is the period from the time a data packet is sent to the time the packet reception confirmation is received. Latency is measured in milliseconds (ms).

The higher the latency, the lowest the network performance will be. High latency values negatively impact real-time application performance, such as video-conferencing and VoIP communications.

Latency for the network AsCancelas

#### **5.2.3.16. PACKET LOSS**

In an ideal data communication, all sent data packets reach their destination; otherwise there is a packet loss that negatively impacts the data transmission performance, hence the overall network performance.

When a data packet is lost, if required by the protocol, it should be re-transmitted until a successful reception notification is received. This increases the amount of time necessary for a data unit to be transmitted, reducing the amount of data that can be transmitted per unit of time. The higher this value is, the lower the network performance will be.

The following image shows the areas where data packet loss is experienced within **AsCancelas** network site range.

*The graph can't be generated due to the absence of the required data.*

### 5.2.3.17. ROAMING

Data roaming in a Wi-Fi network infrastructure is the ability of a client device to move around within a multiple access point network's coverage area without disconnections.

To ensure roaming in a multiple access point Wi-Fi network, access points' coverage ranges should overlap.

Accordingly, a moving client device will have continuous network coverage, and based on the device's internal settings and access point configuration, network access will be granted through the different access points across the coverage area.

The following image shows all **AsCancelas** network access points to which the device has been connected to while itinerating.

Roaming for the network AsCancelas

## 6.2. NETWORK SURVEY: ASCANCELAS

### 6.2.1. NETWORK DETAILS

#### 6.2.1.1. AP-BASED INFORMATION

The following table contains information related to the **AsCancelas** network, which is organized based on its APs:

- SSID: Network identifier offered by the BSSID.
- BSSID: Associated MAC addresses granting network access.
- Channel: Identifier of the frequency associated to the network.
- Frequency: Value of the frequency associated to the network.
- Security: Types of authentication and encryption supported by the network.
- Vendor: Device manufacturer.

	SSID	ASCANCELAS			
	BSSID	CHANNEL	FREQ	SECURITY	VENDOR
1	04:BD:88:F0:D2:C0	1	2412	Open	Aruba Networks
2	04:BD:88:F0:E1:00	1	2412	Open	Aruba Networks
3	04:BD:88:F0:E1:80	6	2437	Open	Aruba Networks

15	24:DE:C6:81:12:12	5	2432	Open	Aruba Networks
16	24:DE:C6:81:15:02	13	2472	Open	Aruba Networks
17	24:DE:C6:81:1C:32	12	2467	Open	Aruba Networks
18	24:DE:C6:81:58:12	13	2472	Open	Aruba Networks
19	24:DE:C6:91:AE:52	1	2412	Open	Aruba Networks

### 6.2.1.2. CHANNEL-BASED INFORMATION

The following table contains **AsCancelas** network related information, which is organized based on the transmitting channels/frequencies:

- SSID: Network identifier offered by the BSSID.
- Channel: Identifier of the frequency associated to the network.
- Frequency: Value of the frequency associated to the network.
- BSSID: Associated MAC addresses granting network access.
- Vendor: Device manufacturer.

SSID	ASCANCELAS

		24:DE:C6:81:11:62	Aruba Networks

**6.2.1.3. "AsCancelas" ACCESS POINT POSITION**

The following image shows the approximate positions of all access points identified during the site survey which are publishing the network **AsCancelas**. These positions are manually configured, or otherwise are automatically estimated based on the measured data.

**Physical APs Position for AsCancelas Network**

	BSSID	SSID	VENDOR	CHAN
1	24:DE:C6:81:0C:32	AsCancelas	Aruba Networks	12
2	24:DE:C6:81:0B:F2	AsCancelas	Aruba Networks	1
3	24:DE:C6:91:AE:52	AsCancelas	Aruba Networks	11
4	24:DE:C6:81:11:62	AsCancelas	Aruba Networks	10
5	24:DE:C6:81:15:02	AsCancelas	Aruba Networks	13
6	04:BD:88:F0:E1:00	AsCancelas	Aruba Networks	1
7	04:BD:88:F0:D2:C0	AsCancelas	Aruba Networks	1

**6.2.2. WiFi QUALITY**

**6.2.2.1. WEB BROWSING WiFi REQUIREMENTS**

**6.2.2.1.1. RSSI COVERAGE**

The Rssi Coverage control displays those areas where the signal strength received from any of the selected access points falls below the selected threshold value. Signal strength has a significant impact on the quality of communications. Signal strength is measured in dBm, and ranges from 0 dBm (stronger) to -100 dBm (weaker).

Acceptable values range from 0 to -75 dBm. Proper communication cannot be guaranteed with lower signal strength values.

RSSI Coverage for the network AsCancelas

Pass	RSSI Required greater than or equal -65 dBm
Fail	

### 6.2.2.1.2. SIMULTANEOUS RSSI COVERAGE

The Simultaneous AP Coverage control displays those areas where signal strength received by any of the network access points is equal or lower than the predetermined threshold value.

To ensure dependable wireless communications, it is necessary, under certain circumstances, that all the points in the coverage area can access a certain number of access points within the network infrastructure, preventing channel overlapping, with at least a minimum signal strength.

Simultaneous RSSI Coverage for the network AsCancelas

<b>Pass</b>	RSSI Required greater than or equal -65 dBm Simultaneous APs Required greater than or equal 2 APs
<b>Fail</b>	

### 6.2.2.1.3. CHANNEL OVERLAP

The Channel Overlapping control shows those areas where adjacent interference requirements are met.

An AP is considered to have an adjacent interference when some of its transmitted frequencies overlap with another AP transmitting on a different channel over the same band.

Channel Overlap for the network AsCancelas

Pass	AP Overlap less than or equal 0 APs Gap RSSI greater than or equal 20 dBm
Fail	

#### 6.2.2.1.4. CO-CHANNEL INTERFERENCE

This control displays those areas where co-channel interference parameters are met.

An AP is considered to have a co-channel interference when there is another AP transmitting on the same channel.

As a consequence of channel overlap, access points occupy the same radio spectrum, sharing it and using it alternately, so only one AP will be transmitting at a time.

This kind of interferences worsen communications performance because it is necessary to analyse wireless space before transmitting. If one AP is transmitting, others must wait for this to stop before they can transmit. This makes total transmission time to be divided into the number of APs that transmit in the same frequency.

Co-Channel Interference for the network AsCancelas

Pass	Overlapping APs less than or equal 1 APs Gap RSSI greater than or equal 20 dBm
Fail	

### 6.2.2.1.5. LATENCY

Latency is the time interval between sending a data packet and receiving it back, in this case, latency is the amount of time a packet takes to be transmitted and received back in the wireless space.

Acceptable latency values range from 1-10ms.

Latency for the network AsCancelas

Pass	Network Latency less than or equal 100ms
Fail	

#### 6.2.2.1.6. BANDWIDTH

The Bandwidth control ensures that minimum bandwidth quality requirements for the connection established by the active survey are met throughout the coverage area.

Bandwidth for the network AsCancelas

Pass	Bandwidth greater than or equal 320 kbps
Fail	

### 6.2.2.1.7. PACKET LOST

The packet loss rate is the percentage of packets that are lost, in other words, that do not reach their destination at the time of establishing communication, and that are (usually) retransmitted. Packet loss has a negative impact on network performance. When a packet does not reach its destination, packet retransmission is usually requested by the recipient to keep communication flowing normally.

Packet loss rates of under 10% are acceptable and will have a negligible impact on network performance in most cases.

Packet Lost for the network AsCancelas

Pass	Ratio Lost less than or equal 25%
Fail	

#### 6.2.2.1.8. ACCESS POINT ROAMING

The Roaming control shows those areas where Roaming is required by extending network coverage through many different access points. In a wireless infrastructure, multiple access points are deployed to provide coverage throughout the desired area.

Roaming allows moving devices to maintain wireless communication by connecting to new access points within the same network to maintain the quality of communication and prevent degradation of signal strength. This service is called Roaming

Access Point Roaming for the network AsCancelas

**6.2.2.2. VOIP OVER WiFi REQUIREMENTS**

**6.2.2.2.1. RSSI COVERAGE**

The Rssi Coverage control displays those areas where the signal strength received from any of the selected access points falls below the selected threshold value. Signal strength has a significant impact on the quality of communications. Signal strength is measured in dBm, and ranges from 0 dBm (stronger) to -100 dBm (weaker).

Acceptable values range from 0 to -75 dBm. Proper communication cannot be guaranteed with lower signal strength values.

RSSI Coverage for the network AsCancelas

Pass	RSSI Required greater than or equal -50 dBm
Fail	

#### 6.2.2.2.2. SIMULTANEOUS RSSI COVERAGE

The Simultaneous AP Coverage control displays those areas where signal strength received by any of the network access points is equal or lower than the predetermined threshold value.

To ensure dependable wireless communications, it is necessary, under certain circumstances, that all the points in the coverage area can access a certain number of access points within the network infrastructure, preventing channel overlapping, with at least a minimum signal strength.

Simultaneous RSSI Coverage for the network AsCancelas

Pass	RSSI Required greater than or equal -45 dBm
Fail	Simultaneous APs Required greater than or equal 5 APs

### 6.2.2.2.3. CHANNEL OVERLAP

The Channel Overlapping control shows those areas where adjacent interference requirements are met.

An AP is considered to have an adjacent interference when some of its transmitted frequencies overlap with another AP transmitting on a different channel over the same band.

Channel Overlap for the network AsCancelas

Pass	AP Overlap less than or equal 0 APs Gap RSSI greater than or equal 20 dBm
Fail	

#### 6.2.2.2.4. CO-CHANNEL INTERFERENCE

This control displays those areas where co-channel interference parameters are met.

An AP is considered to have a co-channel interference when there is another AP transmitting on the same channel.

As a consequence of channel overlap, access points occupy the same radio spectrum, sharing it and using it alternately, so only one AP will be transmitting at a time.

This kind of interferences worsen communications performance because it is necessary to analyse wireless space before transmitting. If one AP is transmitting, others must wait for this to stop before they can transmit. This makes total transmission time to be divided into the number of APs that transmit in the same frequency.

Co-Channel Interference for the network AsCancelas

Pass	Overlapping APs less than or equal 1 APs
Fail	Gap RSSI greater than or equal 20 dBm

#### 6.2.2.2.5. LATENCY

Latency is the time interval between sending a data packet and receiving it back, in this case, latency is the amount of time a packet takes to be transmitted and received back in the wireless space.

Acceptable latency values range from 1-10ms.

Latency for the network AsCancelas

Pass	Network Latency less than or equal 256ms
Fail	

### 6.2.2.2.6. BANDWIDTH

The Bandwidth control ensures that minimum bandwidth quality requirements for the connection established by the active survey are met throughout the coverage area.

Bandwidth for the network AsCancelas

<b>Pass</b>	Bandwidth greater than or equal 5000 kbps
<b>Fail</b>	

### 6.2.2.2.7. PACKET LOST

The packet loss rate is the percentage of packets that are lost, in other words, that do not reach their destination at the time of establishing communication, and that are (usually) retransmitted. Packet loss has a negative impact on network performance. When a packet does not reach its destination, packet retransmission is usually requested by the recipient to keep communication flowing normally.

Packet loss rates of under 10% are acceptable and will have a negligible impact on network performance in most cases.

Packet Lost for the network AsCancelas

Pass	Ratio Lost less than or equal 25%
Fail	

#### 6.2.2.2.8. ACCESS POINT ROAMING

The Roaming control shows those areas where Roaming is required by extending network coverage through many different access points. In a wireless infrastructure, multiple access points are deployed to provide coverage throughout the desired area. Roaming allows moving devices to maintain wireless communication by connecting to new access points within the same network to maintain the quality of communication and prevent degradation of signal strength. This service is called Roaming

Access Point Roaming for the network AsCancelas

### 6.2.3. SURVEY

#### 6.2.3.1. RSSI HEATMAP

Signal Strength translates as how efficiently the network is reaching the surveyed area, indicating how the **AsCancelas** network is received at each location.

Signal strength values range from 0 db to -100db, being -100db the worse performance. The color scheme is shown below the image.

Signal Strength Heatmap for AsCancelas Network

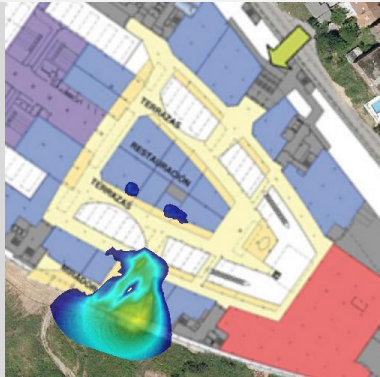

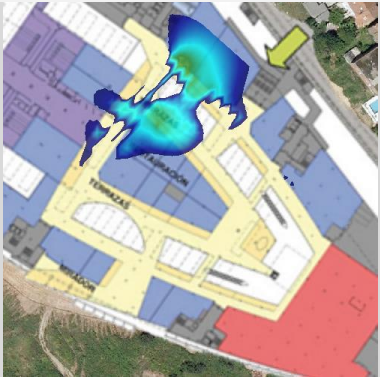

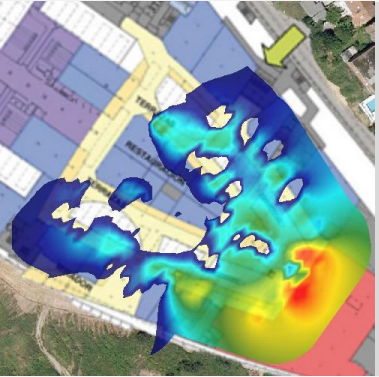

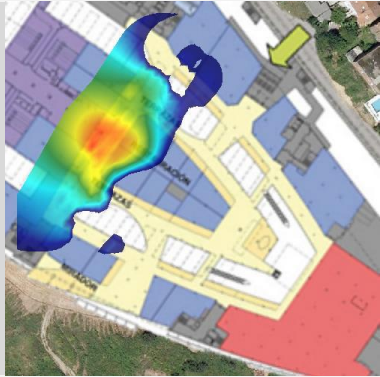

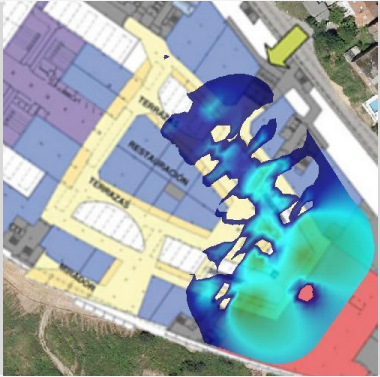

**Network coverage area\* 7730 m2**

\*This information indicates the network coverage area at a signal strength of at least:-75

### 6.2.3.2. RSSI DETAILED BY AP

The following table contains a tile view of all BSSIDs associated to the **AsCancelas** network, along with its signal strength heatmap, associated covered area, and device manufacturer.

### 6.2.3.3. RSSI DETAILED BY CHANNEL

The following table contains a tile view of all operative channels on the **AsCancelas** network.

The graph shows the signal strength heatmap, and the coverage area associated with this network on that channel.

Coverage area: 2968 m2

Coverage area: 5277 m2

**6.2.3.4. NUMBER OF APs**

The following image shows the number of access points granting access to the **AsCancelas** network that were detected within the surveyed area.

The graph reveals the existing signal overlapping from the different access points granting access to the same network.

Number of APs for AsCancelas Network

### 6.2.3.5. AP COVERAGE

The following image shows the color coded coverage of every AP propagating the **AsCancelas** network.

If coverage from two or more channels overlap throughout the surveyed area, then the stronger signal channel is display.

Using this graph, you will be able to analyze the appropriate coverage distribution.

AP Coverage for AsCancelas Network

**6.2.3.6. CHANNEL COVERAGE**

The following image shows the coverage range for every channel in the **AsCancelas** network.

If coverage from two or more channels overlap throughout the surveyed area, then the stronger signal channel is display.

Channel Coverage for AsCancelas Network.

**6.2.3.7. CHANNEL OVERLAP**

The following image shows the coverage area for each operative channel on the **AsCancelas** network, and the signal overlapping between two or more channels throughout the surveyed area.

Channel Overlap for AsCancelas Network

**6.2.3.8. DETAILED GRID**

In the following image, the blueprint associated to the surveyed area is divided into quadrants. Each quadrant shows the collected information in that grid.

Detailed Grid for AsCancelas Location

#### **6.2.3.9. SNR HEATMAP**

The following image shows the **AsCancelas** network's signal-to-noise ratio throughout the surveyed area.

Signal-to-noise ratio measures the ratio between the Wi-Fi network signal strength and the background noise. Higher noise levels will result in a larger negative impact on communications. This parameter offers valuable information on the effectiveness of communications. These values range from 0 to 100, being 100 the best possible communication quality.

*The graph can't be generated due to the absence of the required data.*

### 6.2.3.10. DATA RATE HEATMAP

The following image shows the area covered by the APs based on their data transfer rates for the **AsCancelas** network throughout the surveyed area.

Data rate helps determine the maximum data transmission speed among the wireless devices connected to a Wi-Fi network.

This value allows you to establish how consistent a network is when transmitting data across the coverage area, and helps you find those areas where these values greatly differ or the network performance significantly decreases.

Data Rate for AsCancelas Network

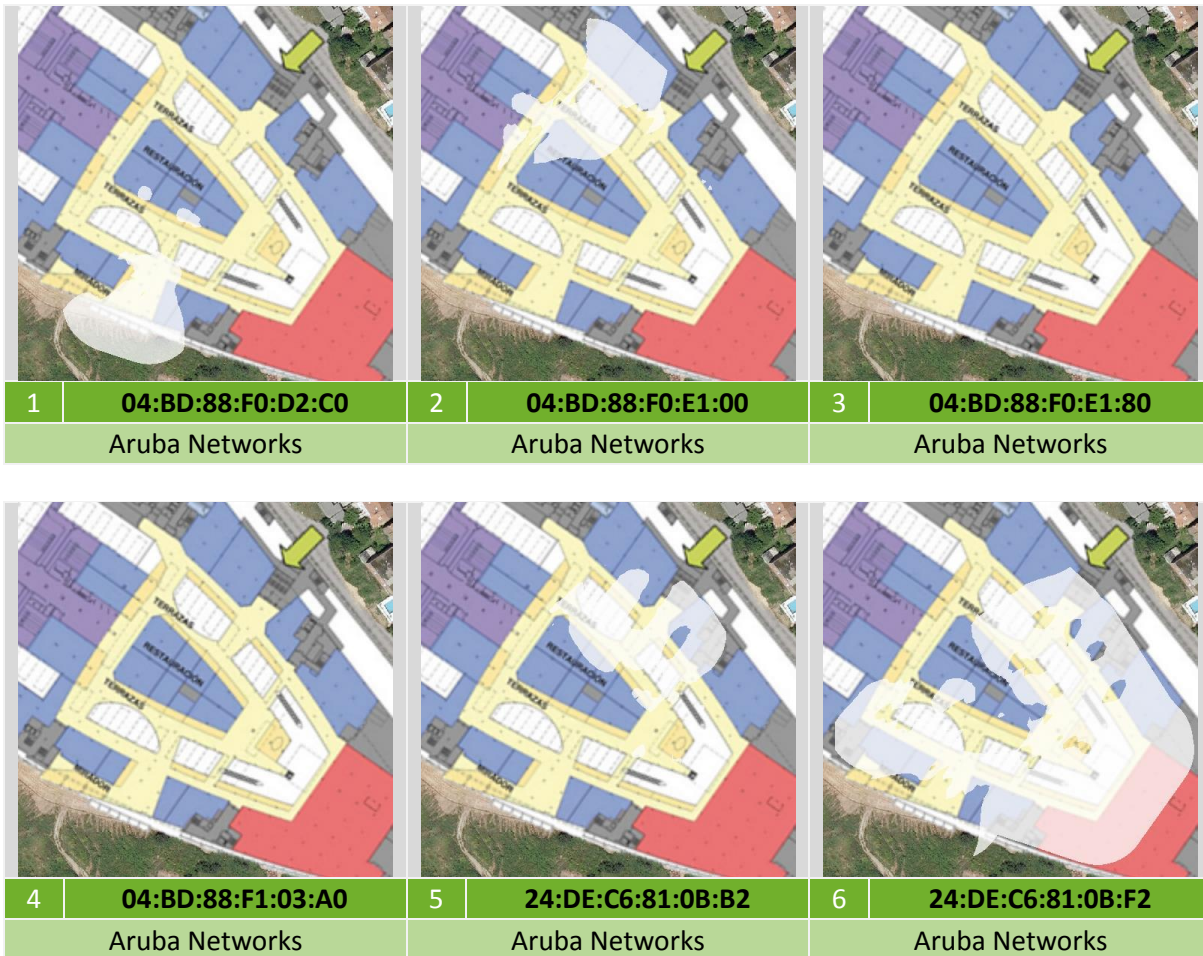

### 6.2.3.11. DATA RATE DETAILED

The following table shows a tile view of all BSSIDs associated with the **AsCancelas** network, together with the graph indicating the covered area and the maximum supported data transfer rate speed.

Data rate helps determine the maximum data transmission speed between the wireless devices connected to a Wi-Fi network.

It allows you to determine how efficiently a network transmits data throughout a certain area, and if there are blind zones where reduced network performance is observed.

#### **6.2.3.12. CELL DENSITY HEATMAP**

The following image shows a heatmap revealing the distribution of all client devices connected to the APs propagating the **AsCancelas** network.

Cell density allows you to spot which zones have the higher number of client devices connected to the network by showing its saturation.

It provides useful information to allow for an even AP distribution according to actual usage.

*The graph can't be generated due to the absence of the required data.*

#### **6.2.3.13. RETRIES RATE HEATMAP**

In an ideal Wi-Fi communication, all sent data packets reach their destination. Otherwise, poor transmission, interferences or any other communication problems can cause the dropped packets to be retransmitted for a correct data transmission. The larger the number of retransmitted or forwarded packets, the larger the communication latency will be, resulting in a lower communication quality.

*The graph can't be generated due to the absence of the required data.*

#### 6.2.3.14. BANDWIDTH

Bandwidth indicates the amount of data being transmitted through **AsCancelas** network for each area within the network site range.

Bandwidth is measured in kilobytes per seconds, KB/s (1MB/s=1000KB/s), where a higher value translates as a better network performance.

Bandwidth for the network AsCancelas

### 6.2.3.15. LATENCY

Latency indicates the time delay experienced in the data transfer through **AsCancelas** network for each area within the network site range.

When a data packet is sent, it is received by a receiving device that notifies the transmitting device that the packet has been successfully received. Latency is the period from the time a data packet is sent to the time the packet reception confirmation is received. Latency is measured in milliseconds (ms).

The higher the latency, the lowest the network performance will be. High latency values negatively impact real-time application performance, such as video-conferencing and VoIP communications.

Latency for the network AsCancelas

### 6.2.3.16. PACKET LOSS

In an ideal data communication, all sent data packets reach their destination; otherwise there is a packet loss that negatively impacts the data transmission performance, hence the overall network performance.

When a data packet is lost, if required by the protocol, it should be re-transmitted until a successful reception notification is received. This increases the amount of time necessary for a data unit to be transmitted, reducing the amount of data that can be transmitted per unit of time. The higher this value is, the lower the network performance will be.

The following image shows the areas where data packet loss is experienced within **AsCancelas** network site range.

Packet Loss for the network AsCancelas

### 6.2.3.17. ROAMING

Data roaming in a Wi-Fi network infrastructure is the ability of a client device to move around within a multiple access point network's coverage area without disconnections.

To ensure roaming in a multiple access point Wi-Fi network, access points' coverage ranges should overlap.

Accordingly, a moving client device will have continuous network coverage, and based on the device's internal settings and access point configuration, network access will be granted through the different access points across the coverage area.

The following image shows all **AsCancelas** network access points to which the device has been connected to while itinerating.

Roaming for the network AsCancelas
